

Update on Water Level of Clark Lake

May 29, 2016

There has been a lot of concern about low water this spring and difficulty with launching boats and installing boat lifts. The levels as recorded at the gage have all been within the accepted range of 8.5-9.0 since early May. The lowest level was 10 days ago at 8.8 and now with all of the boards in place the reading Friday afternoon is 8.94. The lake should fill and expand with the rains predicted this weekend so we should be good if mother nature cooperates.

We will soon be posting a graphic on the website with the current and permitted levels so you can each see the trends.
